Table 2: Recovery Status by Treatment Group

Treatment Arm	Not Recovered	Recovered	Total
Placebo	47 (48.45%)	50 (51.55%)	97
ViralBlock	29 (26.85%)	79 (73.15%)	108
<b>Total</b>	76 (37.07%)	129 (62.93%)	205

*Chi-square test:*  $\chi^2(1) = 10.22, p = 0.0014$

**Table 3. SpO<sub>2</sub> Change from Baseline to Day 28 (ANCOVA)**

	LS Mean (95% CI)	Difference (VRB–PBO)	p-value
Placebo	1.37 [1.13 ; 1.61]	1.88 [1.53 ; 2.22]	0.0001
Viralblock	3.24 [3.00 ; 3.49]		

*Note:* ANCOVA model adjusted for age, sex, and baseline SpO<sub>2</sub>. Viralblock showed a significantly greater increase in SpO<sub>2</sub> at Day 28 compared to Placebo.

Table 5: Results of the logistic regression model used to estimate the propensity score. Neither age nor sex significantly predicted treatment assignment.

**Table 12. Repeated Measures ANOVA on SpO<sub>2</sub> by Treatment Group**

Multivariate and univariate test results from repeated measures ANOVA evaluating changes in SpO<sub>2</sub> across five time points (Days 1, 7, 14, 21, and 28), comparing treatment groups (Placebo vs ViralBlock). Significant Time, Treatment, and Time\*Treatment effects were observed.

Effect	Test	F	DF	p-value
Time (within)	Wilks' Lambda	238.56	4, 295	< .0001

Figure 5: Forest plot of  $\log(\text{Hazard Ratios})$  from Cox regression model adjusted for treatment arm, age, and sex.

**Propensity Score Matching Summary**

The propensity score matching (PSM) was performed using nearest neighbor matching (1:1 ratio, caliper = 0.1). A total of 137 treated subjects (Viralblock) were matched with 137 control subjects (Placebo) within the common support region. The mean difference in propensity scores after matching was 0.0020. The absolute standardized differences for all covariates were reduced substantially, confirming good balance post-matching.

Figure 12. Principal Component Analysis (PCA): Age and SPO2

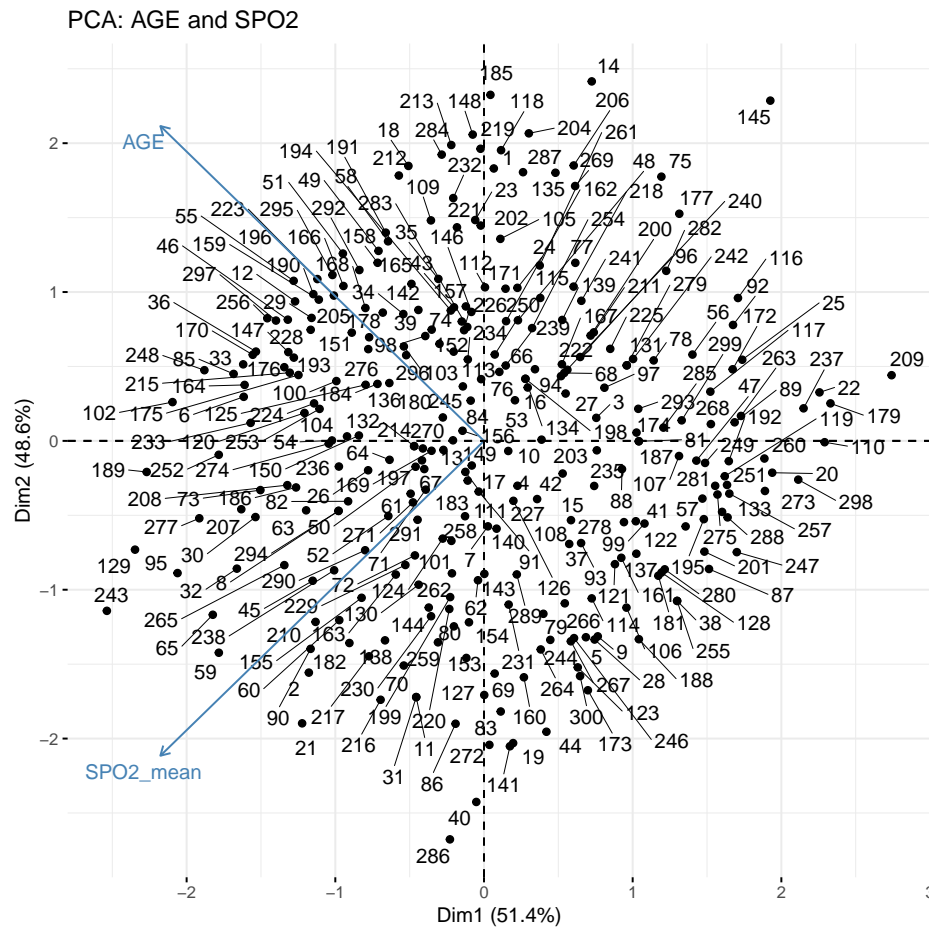

Figure 12: Biplot of the first two principal components based on standardized Age and mean SPO2 per subject.

*Interpretation:* The PCA plot displays how patients distribute along two principal axes combining Age and mean oxygen saturation (SPO2). If observations cluster tightly, it indicates a correlation structure between age and SPO2; spread across components suggests distinct subgroup characteristics. For example, older patients with lower SPO2 may appear on one side, potentially identifying a subgroup with worse baseline status.

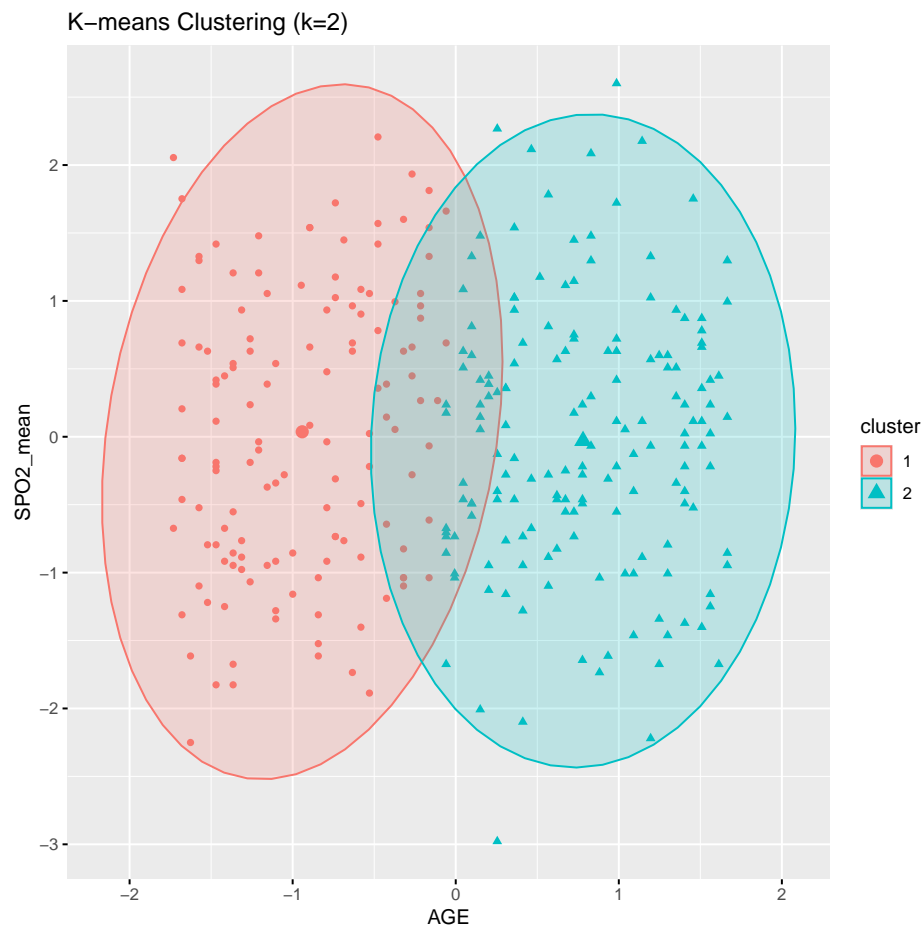

**Figure 13. K-means Clustering ( $k = 2$ ): Age and SPO2**

Figure 13: Cluster plot using k-means ( $k=2$ ) on standardized Age and mean SPO2. Ellipses show cluster groups.

*Interpretation:* The clustering plot separates subjects into two main groups:

- One cluster may reflect younger patients with higher SPO2.
- The other may correspond to older subjects with lower SPO2.

This segmentation reveals how age and oxygen saturation jointly define meaningful patient subgroups, which could be relevant for evaluating differential treatment responses or risk profiles.
